From the stems of *Cassia grandis* three compounds palmitic acid, β-sitosterol and emodin-9-anthrone have been isolated. All of these are being reported for the first time from this plant.

*Cassia grandis* L. (Leguminosae) is a medium sized spreading tree. The pulp from the pods is very strong smelling with a bitter and astringent taste, which has laxative properties. It is sometimes used in veterinary practices also and hence known as Horse Cassia. The leaves are used to treat mange. The juice from the pods is reported to strengthen the blood. A survey of literature revealed no report of the chemical study on the stems of *C. grandis*. Hence, a chemical examination of this plant part was undertaken. Stems of *C. grandis* (5 kg) obtained from Landscape Section, CCS HAU, Hisar, were chopped into small pieces. The dried stems were extracted with hot methanol. The extracts were taken up for phytochemical study by silica gel column chromatography. Elution of the column with benzene-petroleum ether (1:19), benzene and ethyl acetate-benzene (1:9) afforded compound 1 to 3 respectively.

**Compound 1 (Palmitic acid):** It crystallised from benzene as colourless needles (15 mg), m.p. 63°; IR ν<sub>max</sub> (Nujol): 1660 (C=O), 3300 (OH) cm<sup>-1</sup>; ¹H NMR δ (CDCl₃): 10.81 (1H, s, -COOH), 2.30 (2H, t, J = 7.0 Hz, H-2, H-2), 1.61 (2H, br s, H-3, H-3), 1.35 (2H, s, 12 x-CH₂), 0.89 (3H, t, J = 7.0 Hz, Me). A brisk effervescence with sodium bicarbonate solution and the spectral data suggested it to be palmitic acid.<sup>6</sup>

**Compound 2 (β-sitosterol):** It crystallised from benzene as shining white needles (25 mg), m.p. 134°; IR ν<sub>max</sub> (Nujol): 3300 (OH) cm<sup>-1</sup> the acetate ¹H NMR δ; (CDCl₃): 5.36 (1H, br s, H-6), 5.11 (1H, br s, H-3), 2.03 (3H, s, OAc-3), 2.33-0.67 ((47H, m, 7x-CH₂, 11x-CH₂, 6x-CH₂). A positive response to Liebermann-Burchard reaction and the spectral data indicated it to be β-sitosterol.<sup>6</sup>

**Compound 3 (Emodin-9-anthrone):** It crystallised from ethyl acetate as yellow platelets (10 mg), m.p. 255°; It showed a dull red colour with methanolic sodium hydroxide but no colour with methanolic magnesium acetate. IR ν<sub>max</sub> (Nujol): 1640 (C=O), 3150 (OH) cm<sup>-1</sup>; MS m/z (rel. int.): 256 (M⁺, 23.58), 228 (2.89), 213 (3.69), 181 (10.41), 170 (3.03), 168 (100.0), 153 (75.86), 151 (34.29); ¹H NMR δ (CDCl₃): 7.71 (1H, br s, H-2), 7.54 (1H, br s, H-4), 7.25 (1H, d, J = 2.5 Hz, H-7), 7.14 (1H, d, J = 2.5 Hz, H-5), 5.35 (2H, s, H-10, H-10), 2.35 (3H, s, Me). The spectral data and other properties suggested it to be emodin-9-anthrone.<sup>7</sup>

**ACKNOWLEDGEMENT**

We are thankful to Mr. S. R. Dubey, Landscape Section, CCS HAU, Hisar for supplying the plant material.
