Received 31 December 2002

Several N-arylamino-1,3-diazabuta-1,3-dienes were prepared by the reaction of N-arylbenzimidoyl isothiocyanates with primary aromatic amines followed by S-methylation of the resultant thioureas. All these compounds were characterised by analytical and spectral data. Antibacterial activity was determined using agar diffusion technique against Escherichia coli MTCC 42, Pseudomonas aeruginosa MTCC 1034, Bacillus subtilis MTCC 121, Bacillus cerus MTCC 1272 and Staphylococcus aureus MTCC 1430. Some of the compounds showed significant antibacterial activity.

Amidine derivatives possess a broad spectrum of pharmacological action which are reflected by their use as antivirals, antibacterial, antiprotozoal, anthelmintic, antihypertensive, antipyretic and antiinflammatory. In the light of these interesting biological activities, it was decided to synthesize some new amidine derived 1,3-diazabuta-1,3-dienes and assess antibacterial potential. The compounds were conveniently prepared by the reactions of N-aryl benzimidoyl isothiocyanates with primary aromatic amines. Treatment of thioureas with methyl iodide in dry acetone afforded the hydroiodides, which were converted into desired free compounds in good yields by treatment with aqueous potassium hydroxide (Scheme 1). These were isolated as crystalline solids. The identities of products were established by analytical and spectral data. All the compounds synthesized were screened for their antibacterial activity.

All melting points were determined in open capillaries and are uncorrected. IR absorption spectra ($\nu_{max}$ in cm$^{-1}$) were recorded on a Fourier Transform Infrared 8101, Shimadzu spectrophotometer using KBr pellets. Mass spectra were obtained on a Shimadzu GCMS-OP-2000 mass spectrophotometer. Nuclear Magnetic Resonance spectra were recorded on AC 300F, 300 MHz and BZH 200/52, 200 MHz Bruker spectrometers, respectively. Thin layer chromatography was performed using silica gel (G) and spots visualized by exposure to iodine vapours.

4 (a) $R^1 = H$; $R^2 = H$; 4(b), $R^1 = H$, $R^2 = CH_3$; 4(c) $R^1 = H$; $R^2 = CH_3$; 4(d) $R^1 = H$, $R^2 = OCH_3$

N-arylbenzamidines\textsuperscript{12}, N-arylimidoyl chlorides\textsuperscript{12} and N-arylbenzimidoyl isothiocyanates\textsuperscript{12} were prepared by following the reported methods.

Synthesis of 1-aryl-4-(N-aryl amino)-2-phenyl-4-thiomethyl-1,3-diazabuta-1,3-diienes (4a-4g) was achieved by stirring a stirred solution of N-arylbenezimidoly isothiocyanate 1 (2 mmol) in dry acetone (250 ml) was added dropwise a solution of primary amine (1mmol) in dry acetone (30 ml) and stirring continued for 1 h. To this solution, methyl iodide (1.2 mmol) was added dropwise and stirred for a further period of 3-4 h. The separated hydroiodide salt of 3 was filtered, basified with 3N aqueous KOH (50 ml) and extracted with chloroform (3x100 ml). The combined extract was washed with water (3x50 ml) and dried over anhydrous sodium sulphate. The removal of chloroform under reduced pressure afforded the products 4 which were recrystallised from a mixture (1:1) of ethylacetate and hexane.

1,2-Diphenyl-4-[N-phenylamino]-4-thiomethyl-1,3-diazabuta-1,3-diene (4a): 90%, m.p. 142-144\textdegree. $v_{\text{max}}$: 1600 cm$^{-1}$ (C=N). $\delta_{H}$: 2.51 (s, 3H, -SCH$_3$); 7.08 – 7.80 (m, 15H, arom.) and 8.90-9.68 (bs, 1H, -NH). M$: 389. 4-[p-methyl anilino]-2-Phenyl-1-p-toly]-4-thiomethyl-1,3-diazabuta-1,3-diene (4g): 91%, m.p. 116-118\textdegree. $v_{\text{max}}$: 1590 cm$^{-1}$ (C = N). $\delta_{H}$: 2.31 (s, 3H, -CH$_3$); 2.40 (s, 3H, -CH$_3$); 2.53 (s, 3H, -SCH$_3$); 6.80–7.81 (m, 13H, arom.) and 9.46 (bs, 1H, -NH). M$: 373.

The antibacterial activity of the synthesized compounds was determined using agar well diffusion method\textsuperscript{12}. The compounds were taken at a concentration of 1 mg/ml using dimethyl sulfoxide (DMSO) as solvent by agar well diffusion method against gram positive organisms that include, Bacillus subtilis, Bacillus cereus and Staphylococcus aureus and gram negative organisms such as Escherichia coli and Pseudomonas aeruginosa. Nutrient agar was melted in a water bath and cooled at 45\textdegree with gentle shaking to bring about uniform cooling. It was inoculated with 0.5 ml of 24 h. old culture aseptically and mixed well by gentle shaking before pouring onto the sterilized Petri dishes (20-25 ml each

Petri plate). The poured material was allowed to gel. After
gelling the medium, pores were made using a sterile cork
borer and scooping out the punched part of the agar. Into
these wells were added 0.05 ml portions of the test
compound in solvent. The drug solution was allowed to
diffuse for about an hour into the medium. The plates were
incubated at 37°C for 48 h. DMSO was taken as control to
know the activity of solvent. The standard drug ciprofloxacin
was also screened under similar conditions for comparison.
The results for the antibacterial screening are presented in
Table 1.

It has been observed that some of these compounds
exhibited interesting antibacterial activities. Results reveal
that compound 4b and 4d were active against both gram
positive and gram-negative bacteria where as compound 4c
and 4f were active against E. coli and B. cereus. Antibacterial
data indicated that compound 4a and 4e did not show any
significant antibacterial activities. It has been observed that
activity shown by compound 4g against P. aeruginosa was
comparable to that of standard drug. The screening results
indicated that compounds 4a-4f (except 4g) were mild to
moderately active against E. coli at a concentration of 1 mg/
ml.

ACKNOWLEDGEMENTS

The authors are thankful to Dr. H. S. Saini, Senior
Lecturer, Department of Microbiology, Guru Nanak Dev
University Amritsar for his kind assistance throughout the
work.

Received 2 February 2003

A simple method for synthesis of oleanolic acid hemiphthalate disodium salt has been successfully
developed. The structures of the newly synthesized compounds were elucidated on the basis of
analytical and spectral data. The antiinflammatory activity of oleanolic acid hemiphthalate disodium
